Acknowledgements

The Hamilton Township (Mercer County) Stormwater Catch Basin Assessment has been produced by the **Rutgers Cooperative Extension (RCE) Water Resources Program**.

Funding for this project was generously provided by the **Township of Hamilton, Mercer County, New Jersey** and in part by the **New Jersey Agricultural Experiment Station** through the United States Department of Agriculture.

Introduction

Hamilton Township, located in Mercer County, New Jersey, owns and operates about 7,292 stormwater inlets and catch basins that drain into waterways throughout the township. This is a summary of the inlet and catch basin inspection program conducted in 2026 by the Rutgers Cooperative Extension (RCE) Water Resources Program. The purpose of the program is to provide an assessment of existing conditions related to obstruction of flow within the catch basin box due to sediment or debris accumulation atop the grate as well as identifying catch basins in need of repair. This assessment evaluates the overall integrity of the inlet and catch basin structures by prioritizing maintenance for each inlet/catch basin in terms of cleaning, repairs, and overall needs. Although this report addresses inspections conducted for both inlets and catch basins, the term “catch basins” will be used throughout the remainder of the report to refer to both.

All catch basins that are “owned and operated” by Hamilton Township per the municipal separate storm sewer system (MS4) permit from the New Jersey Department of Environmental Protection (NJDEP) are required to be inspected once every five years. Moving forward, one of five inspection zones will be inspected each year. Hamilton Township has existing Snow Zones which are used to divide inspections each year as evenly as possible. Inspection Zone 4 includes a central portion of Hamilton Township (Snow Zone F). The RCE Water Resources Program was responsible for inspecting 1,000 catch basins in Snow Zone F over the summer of 2026. The Hamilton Department of Public Works (DPW) is responsible for inspecting the remaining catch basins in the same snow zone.

All efforts for this project were for the purposes of inspecting catch basins to maintain their function to ensure proper drainage and to prevent clogging and flooding. The assessments were performed from July to August 2026 by the RCE Water Resources Program.

Methods and Procedures

A multi-part approach was taken to assess catch basins that are owned or operated by Hamilton Township. A geographic information system (GIS) was used to visualize the location of mapped catch basin locations using existing data. Hamilton Township utilizes the web-based

GIS application TRAISR to manage their digital stormwater assets, so a digital inspection form was created inside TRAISR for ease of entry and to allow seamless collaboration between the RCE Water Resources Program and Hamilton Township. Inspection personnel created work orders for each catch basin that was inspected.

The software allowed staff to photograph and record data for each stormwater catch basin assessed. This collected data included information about the properties of the catch basin (e.g., depth, grate dimensions, box material, inlet diameters, etc.) as well as needs for maintenance or repair of catch basin structures. These collected data were processed and standardized as needed for consistency across the dataset. These data were analyzed and visualized using ArcGIS Pro.

A total of 1,132 catch basins were inspected in 2026 in Snow Zone F by the RCE Water Resources Program and DPW combined as of this report. This is out of 7,292 Hamilton Township-owned or operated stormwater catch basins, including catch basins in the right of way, on municipally owned property, and in stormwater related easements. Of the 1,132 catch basins inspected in Snow Zone F, 74 were already inspected by the DPW, 1,021 were successfully inspected by the RCE Water Resources Program, 32 were reported not to exist, three (3) were reported to not be catch basins, one (1) is suspected to be a duplicate of another point, and one (1) was otherwise not found. There were an additional 117 catch basins that were inaccessible primarily due to either being on residential or commercial property. Tables summarizing the site inspections for the catch basins that were inaccessible, not found, or reported to not be catch basins are included in Attachment 2.

A prioritization scale was utilized to compare cleaning, repair, and overall priority. Higher overall priority was assigned to catch basins that exhibited significant signs of deterioration than to those that exhibited signs of obstructed flow that only impaired their capacity to handle stormwater inundation. All catch basins were placed on a scale from one (1) to five (5), with one (1) indicating no maintenance necessary and five (5) being the highest priority and needing immediate attention. Any catch basin assigned a priority level of three (3) or higher should be addressed for maintenance or for repair.

Summary of Key Findings

The following conclusions were drawn after reviewing data for the 1,021 catch basins that were successfully assessed. Table 1 summarizes these findings. Based on medium being the action level, 73 catch basins are in need of cleaning, and 48 are in need of repair. For overall priority, there are 89 catch basins that are in need of attention first.

Table 1: Count of Zone F catch basins in each cleaning, repair, and overall priority tier

	(1)-None	(2)-Low	(3)-Medium	(4)-High	(5)-Highest
Cleaning Priority	797	151	40	24	9
Repair Priority	865	108	40	5	3
Overall Priority	672	260	61	19	9

A series of maps is shown in Attachment 1 to show the spatial distribution of the priority criteria assigned to the catch basins inspected by the RCE Water Resources Program. A series of tables is provided in Attachment 2 to highlight each priority criterion as well as identify catch basins that were inaccessible, could not be found, or should be removed from the dataset. Catch basins inspected by the DPW in Snow Zone F are not included in either attachment. The full dataset with images of each catch basin can be viewed through the TRAISR application. The TRAISR dataset can be filtered and sorted with these criteria to navigate the data more easily than the static tables.

Recommendations

Based on the assessment and summary of key findings, recommendations are as follows:

1. The nine (9) catch basins identified as highest overall priority should be visited by Hamilton Township personnel, followed by the 19 high priority catch basins. A plan and schedule should be developed to take the necessary corrective actions as soon as possible.
2. A complete maintenance plan and schedule should be developed for all stormwater catch basins in Region 4 to address the deficiencies noted in this assessment in a timely manner starting with those with highest priority.
3. Each year, subsequent Regions should be inspected (Region 5 in 2027, Region 1 in 2028, etc.).

This assessment was not intended to be a complete and comprehensive inventory of all catch basins owned and operated by Hamilton Township. Efforts for this project focused solely on mapping and inventorying known municipally maintained catch basins located in Snow Zone F. The remaining inspections in Inspection Zone 4 should be completed by the DPW to fulfill the required assessments for this year.

Several points in the dataset do not have a UID or have a UID marked as “0”; these points are represented as “0” in Attachment 2. It is recommended that each of these points be assigned a new UID to facilitate identification and tracking. Additionally, it is recommended that points identified as “Does Not Exist” in the 2026 annual inspection report, as well as in previous inspection reports, be removed from the dataset unless there is evidence indicating that the point does exist.
